

Deploy your web application

If you use local host:

Your web is currently at: `http://localhost:3000`

Your db is currently at: `mongodb://localhost:27017`

This is great for testing, but now we need to use data server to host node.js server

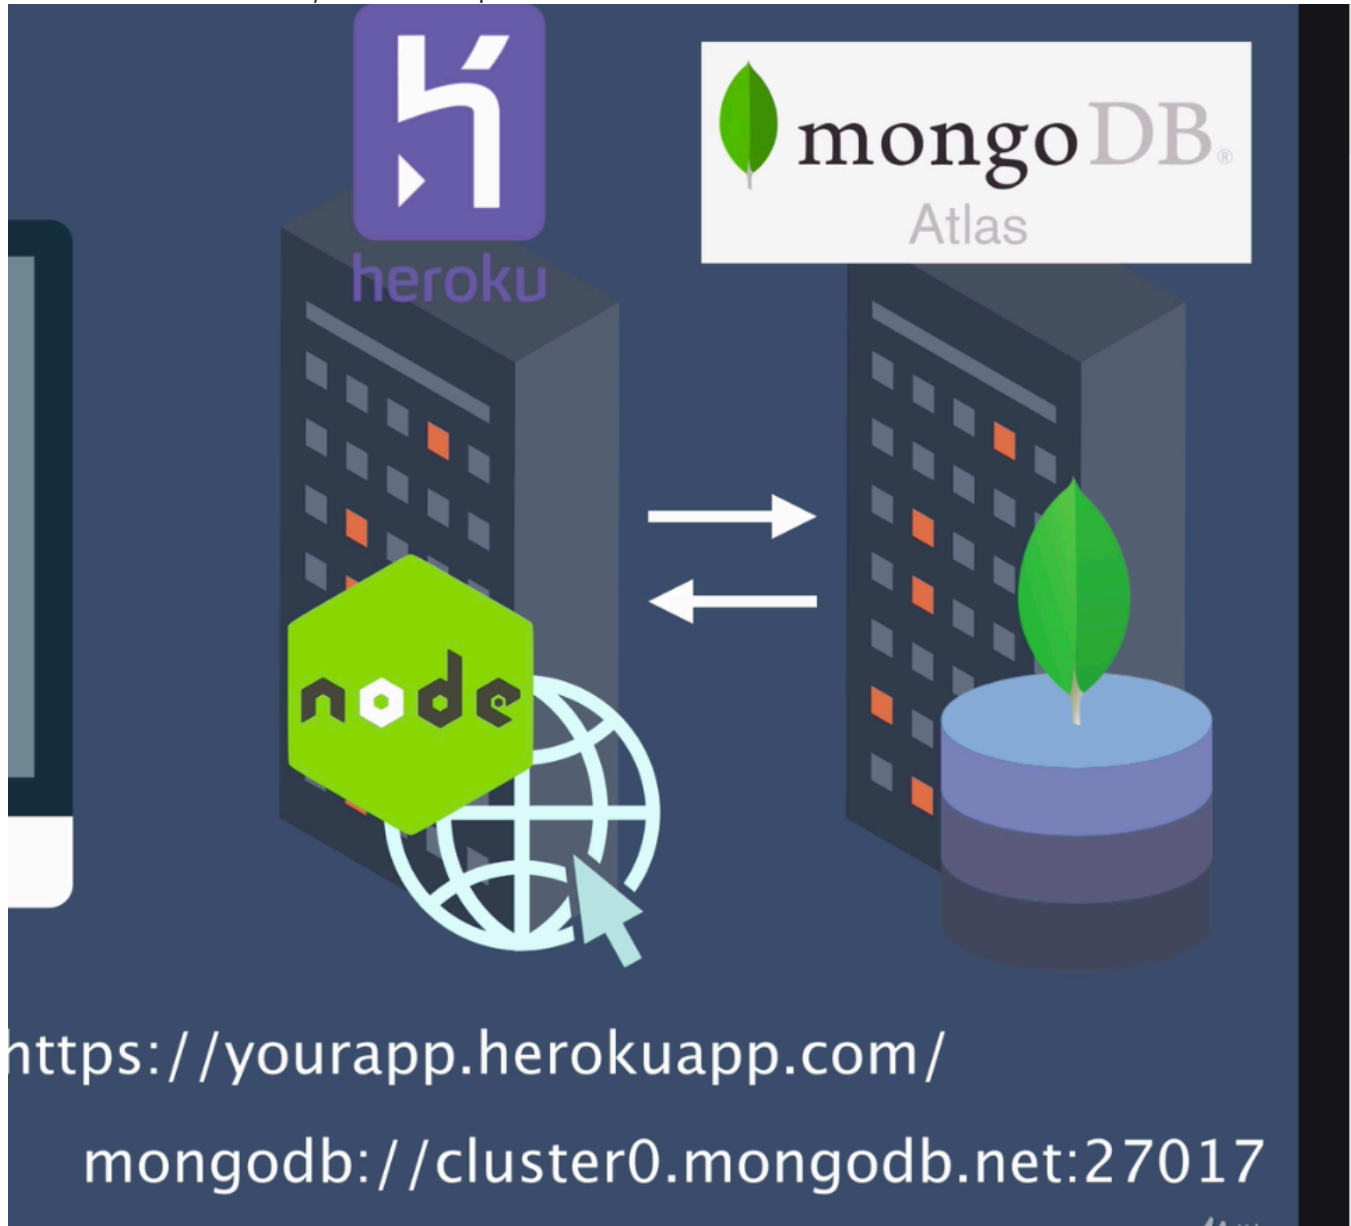

We've been trying heroku (<https://devcenter.heroku.com/>)

but this could only use it when there is no database. (Your database is still local)

We need to set up another server to serve them mongodb database.

Here we use, mongodb owned cloud server: Atlas.

Atlas host the database, and serve up the data whenever it is needed.

User will go to heroku.com, and your backend would connect to MongoDB.
MongoDB Atlas
